

Your Warehouse Management System

A plain-language summary — what's built, what works today, and what's next

What this is

A custom system built for ecomglider to handle the whole flow of an Amazon order: pulling the order in automatically, telling your warehouse staff exactly what to pick and where, packing it correctly, and buying the Amazon shipping label — without anyone re-typing an order by hand.

It's a real, working web app your team can use from a phone or computer browser — not a mockup. You can try it right now at:

<https://wms.mailrajulsingh-in.workers.dev>

How an order flows through it

- 1 An order is placed on Amazon.
- 2 The system automatically pulls it in — no manual copying.
- 3 An admin groups open orders into a “pick batch” and generates a pick list, sorted by warehouse zone and bin so a picker walks the shortest route.
- 4 The picker works through the list on their phone, tapping “Picked” for each item (with a photo and product name shown, so there's no guesswork).
- 5 The packer scans and packs each item into a box.
- 6 The system buys the Amazon shipping label directly (once fully switched on — see “Waiting on Amazon” below), using a box size you've set up and the order's weight.
- 7 The label is applied, the order is marked ready to ship.

What's working right now

- **Automatic order pulling** from your real Amazon seller account (not test data) — confirmed working with a real order from your store.
- **Product photos and titles pulled from Amazon's own catalog** automatically, the first time a product is ordered — no manual data entry.
- **Pick lists** grouped by warehouse zone and bin, matching how Amazon's own fulfillment tools present a pick list — simple enough that picking doesn't require scanning every single unit.
- **Packing** with a scan-to-verify step, so the wrong item can't get sealed into the wrong box.
- **A safety check on shipping labels:** the system will hard-stop and refuse to mark an order ready if the wrong label or a duplicate label is about to be used.
- **An admin screen** to import orders, build pick batches, print pick lists, and manage settings.

- **Two simple logins:** one for admin/office use, one for warehouse floor staff — no complicated account setup needed for your team.

Waiting on Amazon (not something to fix on our side)

The very last step — actually buying the shipping label from Amazon — needs one more permission (called a “role”) approved on Amazon's side, beyond what was already granted. This has been requested. Everything up to that point (pulling orders, generating pick lists, picking, packing) works today regardless of this. Once Amazon approves it, label buying will start working with no further changes needed.

What's next

- Printing the item's SKU and quantity directly onto the shipping label (in the corner), the way it's done manually today.
- Deciding, together, whether the packing step should also drop barcode-scanning in favor of matching against the printed label — once labels carry that printed detail, scanning may no longer be needed there either.
- An inbound/inventory tracking module — for receiving new stock into the warehouse and keeping counts accurate over time.
- Entering your real box sizes into the system (only one test size exists right now).

Try it yourself
